ELASTIC OBSERVABILITY · ANALYST BRIEFING

Elastic Metrics

Entering the fastest-growing segment in observability.

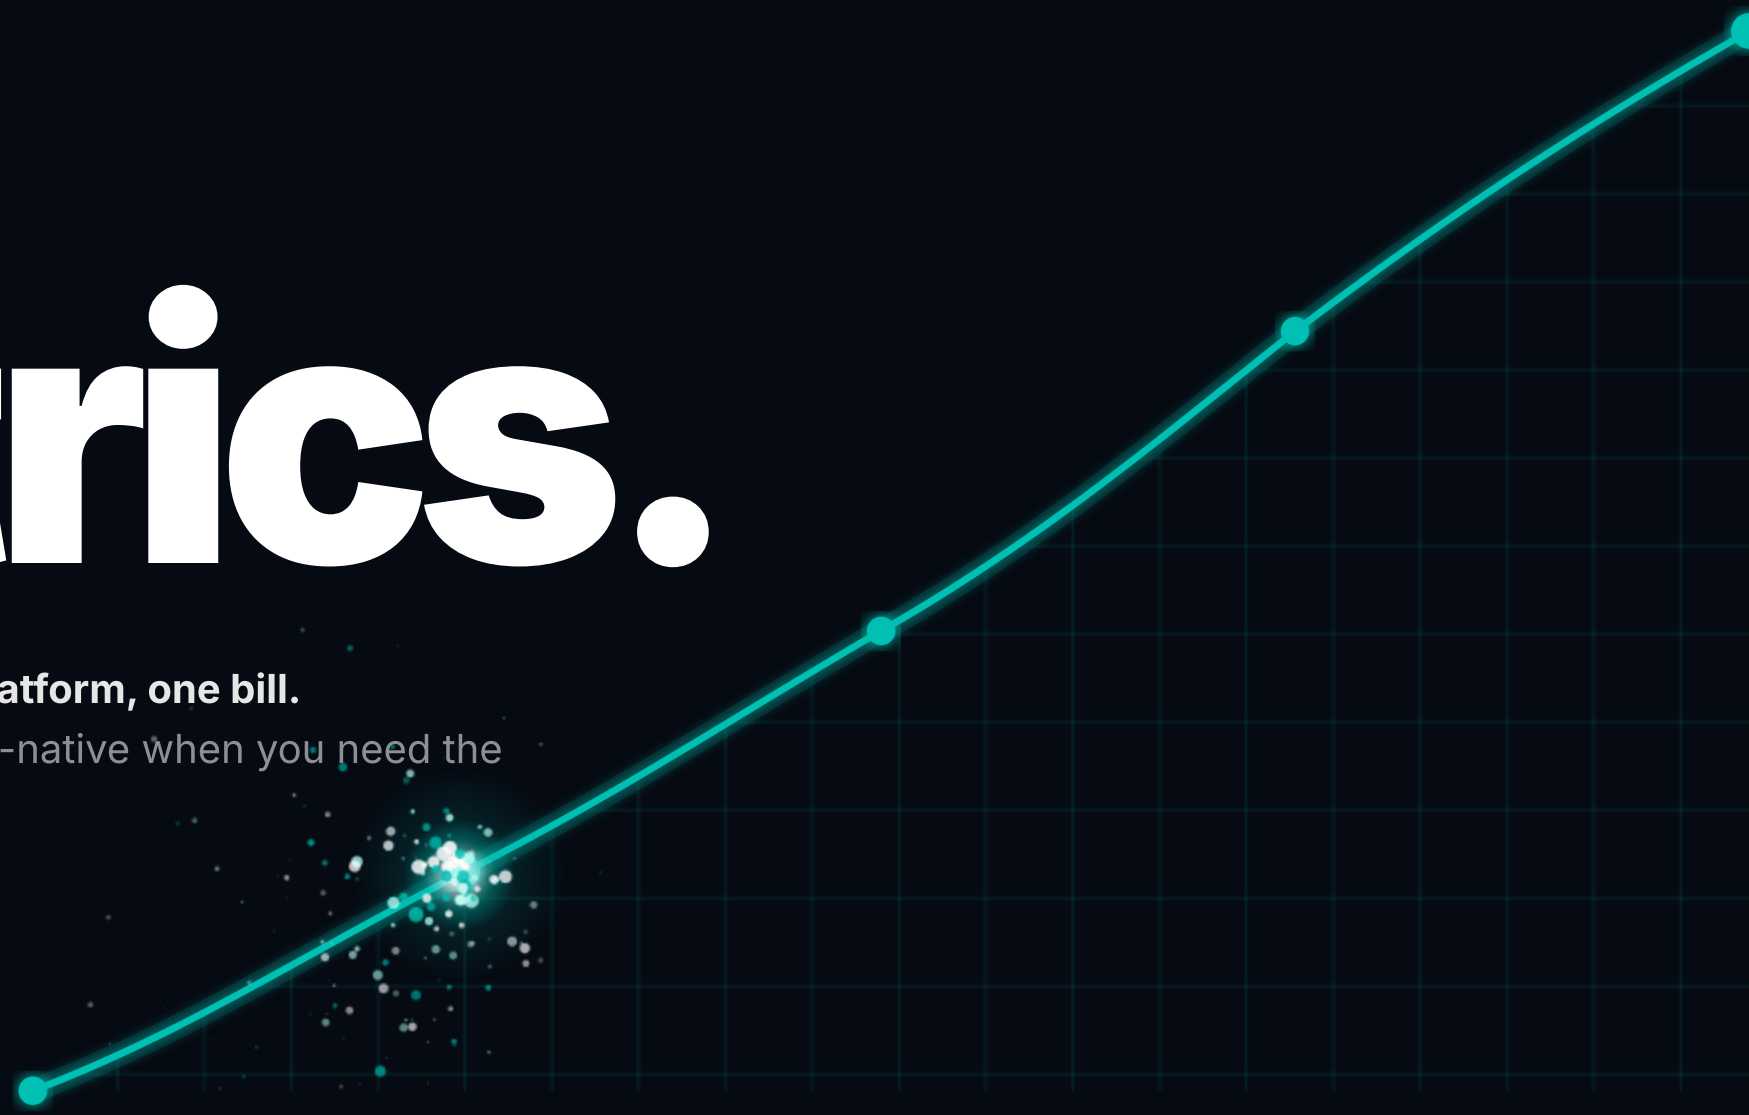

JULY 2026

FY27 · BIGGEST LAUNCH IN YEARS

Metrics.

Metrics, logs, and traces — **one platform, one bill.**
30× faster. 4× lower cost. PromQL-native when you need the bridge.

June 29, 2026

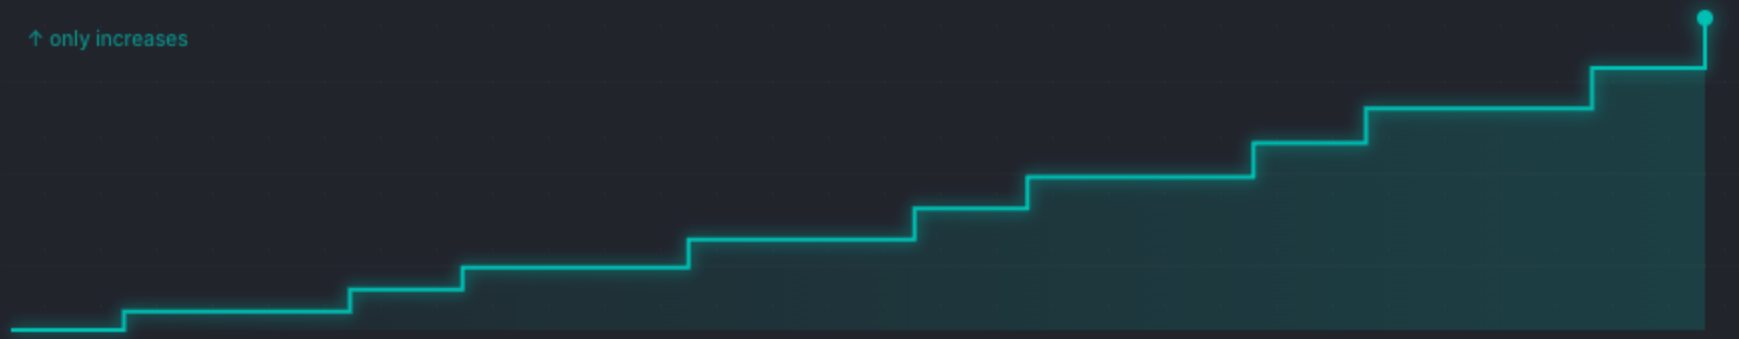

FOUNDATIONS

Metrics are what **wake engineers up** at 3am.

The highest-frequency signal in observability — and the primary source of alerts that drive incident response.

COUNTER `http_requests_total`

Monotonically increasing. Only ever goes up. Rate of change reveals throughput.

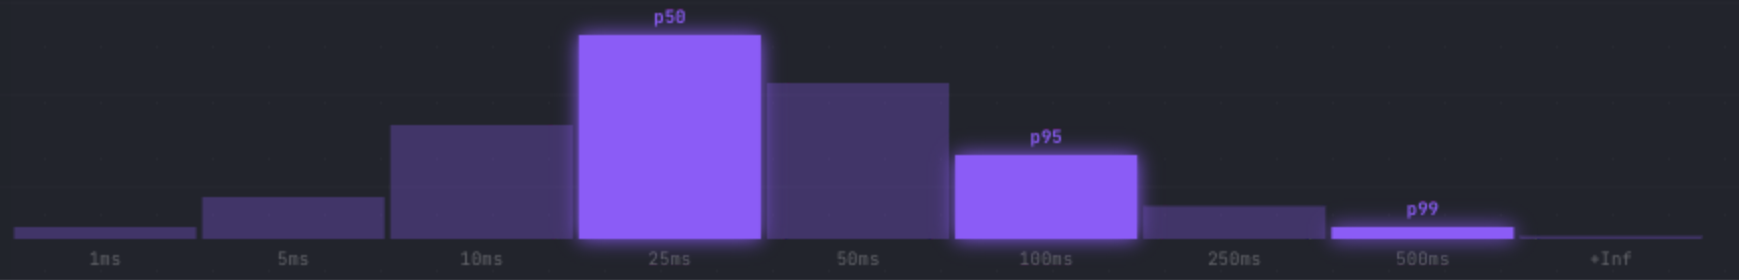

GAUGE `cpu_usage_percent`

Point-in-time snapshot. Can go up or down — memory, queue depth, active connections.

HISTOGRAM `request_duration_seconds`

Distribution across buckets. Reveals p50, p95, p99 latency from a single metric.

Alerts fire on metrics thresholds. Dashboards visualize metrics trends. **PromQL** *is the query language that makes it all work — 20M+ deployments speak it natively, and so does Elastic.*

THE ARCHITECTURE SHIFT

We rebuilt metrics **from the ground up.**

Because the observability stack of 2024 was not designed for the AI era.

BEFORE

~~Metrics as second-class citizens~~

Standard index-based storage. Not optimized for time-series access patterns. High storage cost, slow range queries.

→

NOW

TSDS — Time Series Data Stream

Purpose-built storage with automatic rollup, downsampling, and compression.

`↑ 6.6× storage efficiency`

BEFORE

~~No native PromQL~~

Separate Prometheus infrastructure required. Two stacks to operate, two bills to pay. Elastic wasn't in the metrics conversation.

→

NOW

PromQL-native in Kibana

Full PromQL support built into Elasticsearch. Existing dashboards, queries, and alerting rules work without modification.

`↑ zero migration tax`

BEFORE

~~Built for human-generated telemetry~~

Designed for hundreds of services. AI agents generate 100× more series — ephemeral, high-cardinality, bursty. The old architecture couldn't keep up.

→

NOW

Built for AI-era scale

Handles millions of active series without performance degradation. Metrics aren't isolated data — they're signals for autonomous operations.

`↑ 160× faster queries`

Elastic is no longer a logs company that also does metrics. **Metrics is now a first-class, production-ready capability.**

• GA JUNE 29, 2026

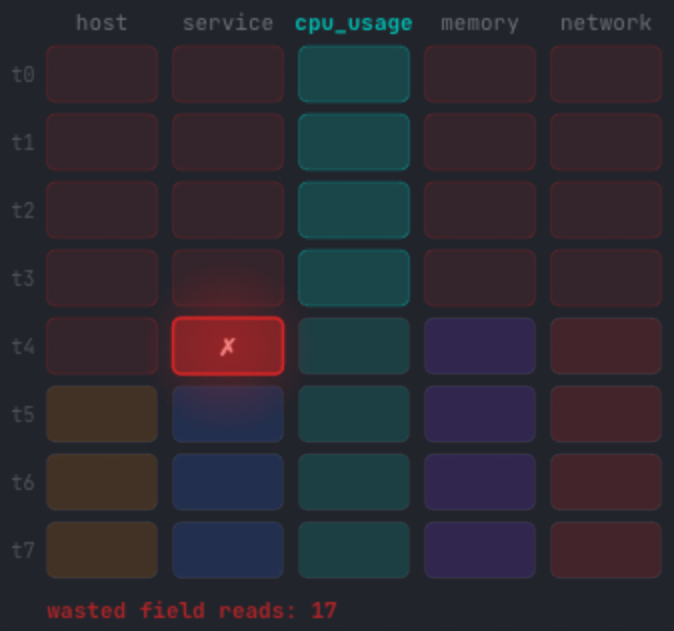

COLUMNAR ENGINE · ARCHITECTURE SHIFT

From 25 bytes to 3.75 bytes per data point. Same query. Watch the difference.

ROW-BASED · BEFORE

SELECT cpu_usage FROM metrics — 8 rows

QUERY TIME 2,041ms

Every row stores all fields together. To read `cpu_usage`, you skip 4 irrelevant fields in every row.

160×
FASTER QUERIES

6.6×
LESS STORAGE

25→3.75
BYTES / POINT

FULLY COLUMNAR
ES 9.3–9.4

COLUMNAR · NOW

Same query — reads one column only

QUERY TIME 24ms ✓ DONE

Each field is its own column on disk. Reading `cpu_usage` means one sequential pass — zero wasted reads.

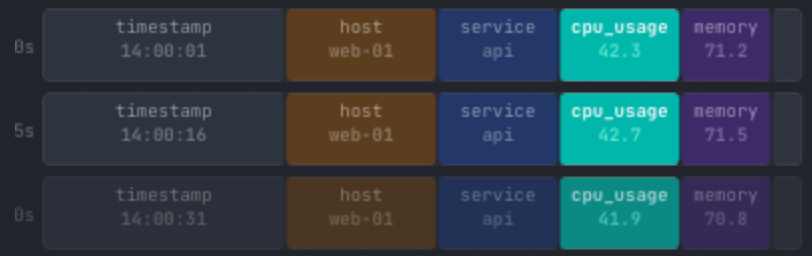

STORAGE EFFICIENCY · WHY COLUMNAR COMPRESSES BETTER

Same data. 6.6× less space. Because similar values next to each other compress dramatically better.

ROW-BASED · 25 BYTES / POINT

8 measurements — all fields mixed together

TOTAL SIZE **75 bytes**

Mixed types, no pattern. Each row has a hostname string next to a float next to an integer — delta encoding finds nothing to compress.

6.6×
LESS STORAGE

WHY IT COMPRESSES

- Similar values are adjacent → delta encoding works
- One type per column → type-optimised codec
- 512-block encoding → repeated patterns collapse
- No stored _id or seq no → less metadata overhead

25 → 3.75
BYTES PER POINT

COLUMNAR · 3.75 BYTES / POINT

Same data — grouped by field, delta-encoded

TOTAL SIZE **184 bytes**

timestamp	host	cpu_usage	memory	service
00:01	web-01	42.3	71.2	api
00:16	web-01	42.7	71.5	api
00:31	web-01	41.9	70.8	api
00:46	web-01	43.1	72.1	api
01:01	web-01	42.5	71.3	api
01:16	web-01	41.8	70.6	api
01:31	web-01	43.3	72.4	api
01:46	web-01	42.1	71.0	api

Delta-encoded, type-optimised. `cpu_usage` values 42.3→42.7→41.9 differ by fractions — deltas fit in 1–2 bytes, then compress further with Gorilla/XOR.

ELASTIC OBSERVABILITY · METRICS

Best in class efficiency for Metrics

ELASTICSEARCH 9.4 BENCHMARKS

Blazing Fast Query Performance

30× faster: Prometheus & Mimir

- up to 30× faster — vs Prometheus
- up to 30× faster — vs Mimir
- 7× faster — vs ClickHouse

WHY IT MATTERS

Delivers faster AI investigations.

GA — Blazing fast: 30× vs Prom, Mimir

Significant Storage Efficiency Gain

6.6–8× overall vs ES 8.x

- 2.6× better — vs Prometheus
- 2× better — vs ClickHouse

WHY IT MATTERS

Faster root cause. Store more for richer AI context at lower cost.

GA IN 9.4

Prometheus-native Ingest & PromQL

on par

- on par — with Mimir (404K) & Prometheus
- 1.4× better — vs ClickHouse

WHY IT MATTERS

Zero friction to switch. Engineers using Grafana feel right at home.

TECH PREVIEW

Migrate in 1 day from Datadog and Grafana → Elastic

THE NEW OFFERING

Elastic Metrics.

GA June 29, 2026

Fully functional. Deeply integrated. AI-ready.

FULLY FUNCTIONAL

- **PromQL support** — 80%+ of Grafana dashboards work natively
- Full alerting rule compatibility
- Histogram, gauge, counter, summary — all metric types
- Recording rules and federation support
- Kibana as your metrics UI — no Grafana dependency required (but Grafana still works)
- Downsample and rollup out of the box

RICH CONTENT

- **1,000+ out-of-the-box dashboards**
- OpenTelemetry metrics ingestion (native)
- Prometheus remote write compatible
- 300+ pre-built integrations — Kubernetes, AWS, GCP, Azure, databases
- Automatic detection of metric types
- Pre-built alerting rules for common stacks

AI-READY

- **Feeds AI SRE agents** natively
- Metrics anomaly detection built-in
- Automated baseline learning
- Plain-English metric exploration — natural language to PromQL
- Correlated with logs and traces for root-cause acceleration
- Same platform: no data movement, no ETL, no API glue

We are ready.

Production GA. Enterprise scale. Competing for every metrics budget in our installed base.

30× faster

4× lower cost

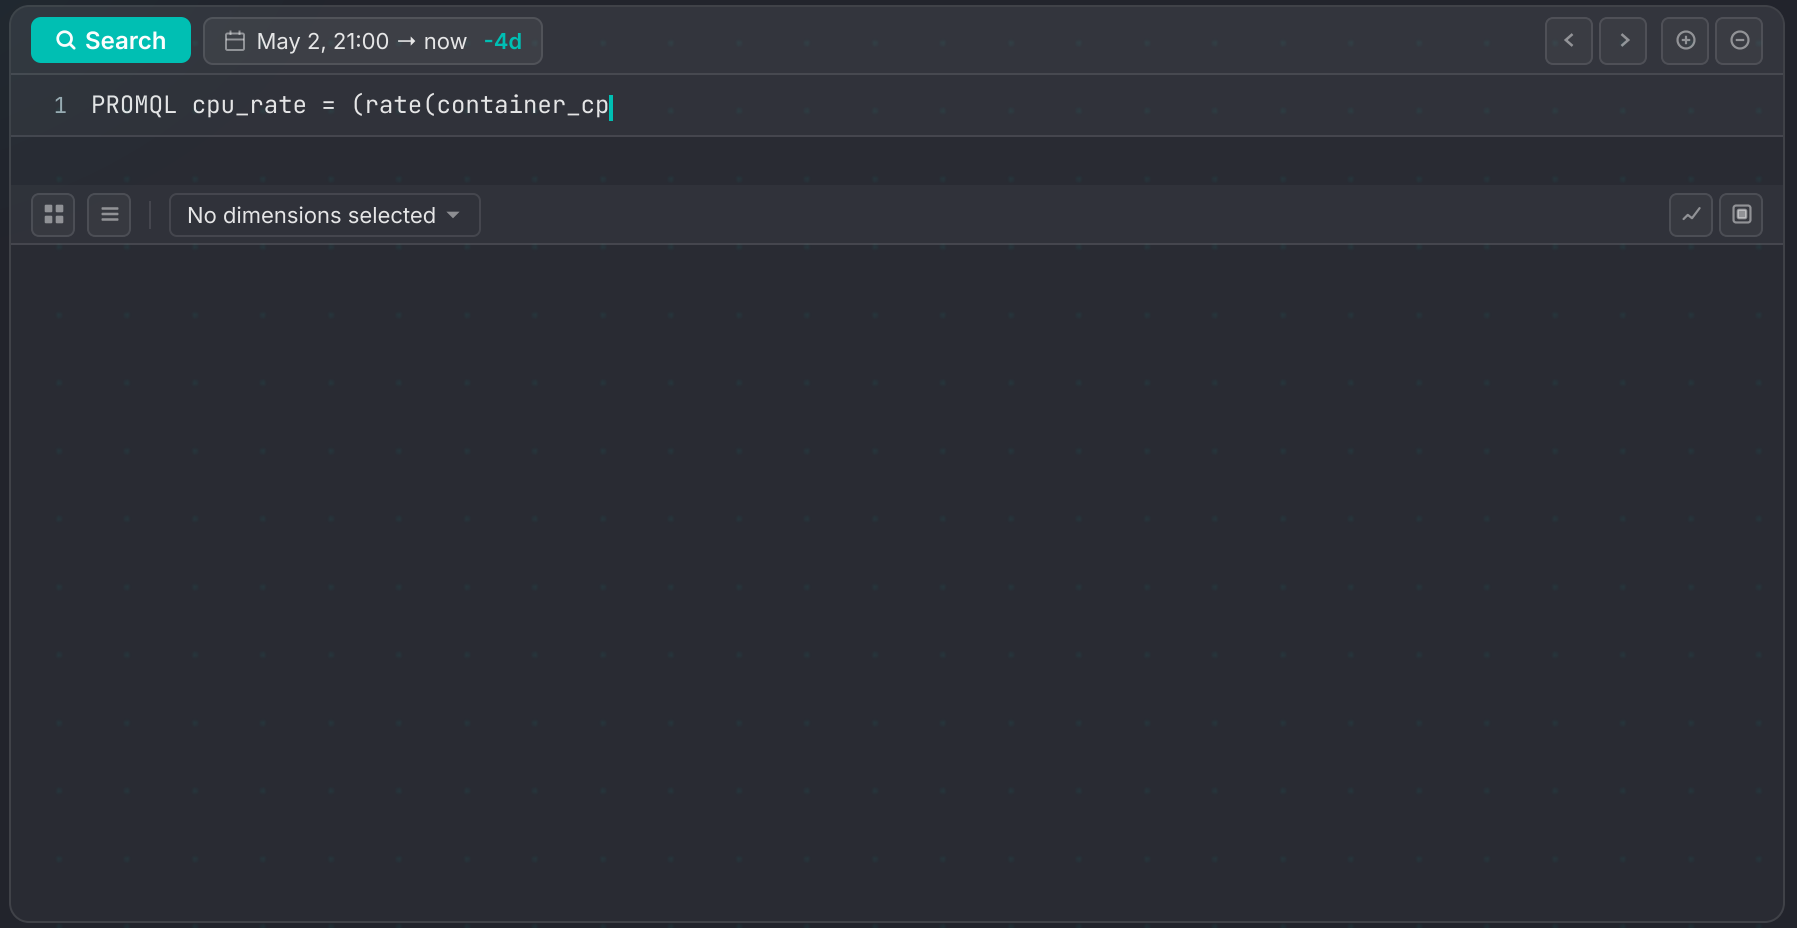

Your SREs already speak PromQL.

Now Kibana does too.

80%

of queries in the top 100 Grafana dashboards

natively executed in Kibana

Native in Kibana
No plugins, no adapters. Runs wherever ES|QL is supported.

Rich Analytics
rate, irate, sum by, max_over_time — works out-of-the-box.

up to 30× Faster
Same queries as Prometheus with significantly better performance.

elastic

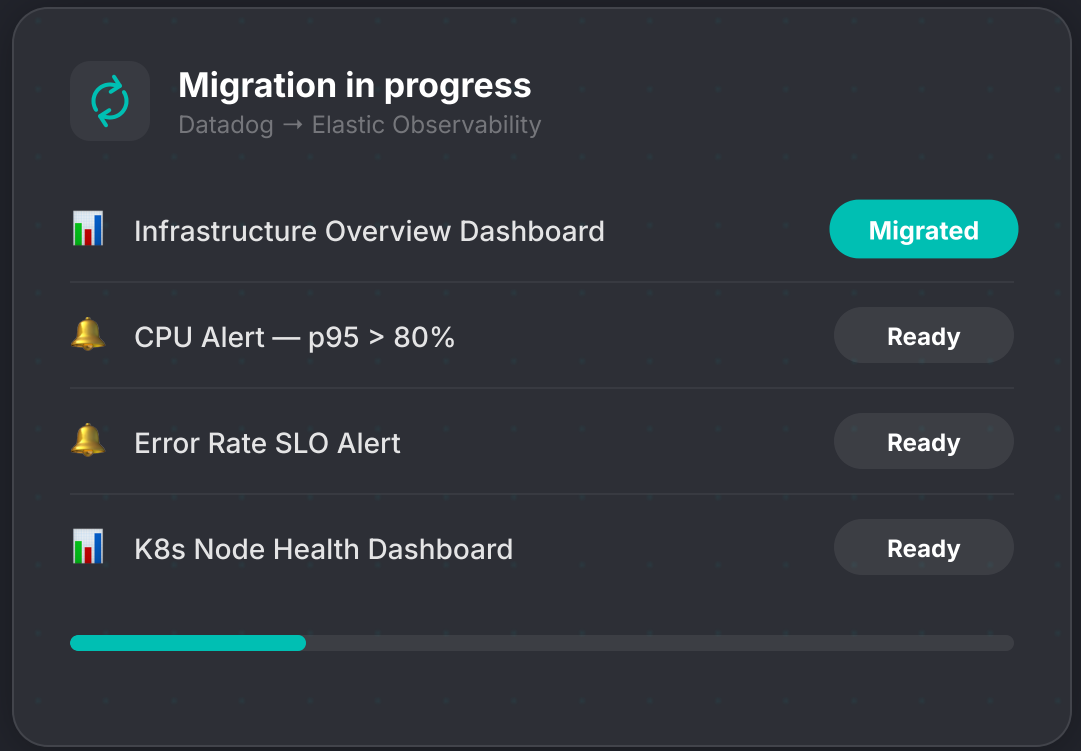

Migrate from Datadog or Grafana overnight.

Automatically converts your dashboards and alerting rules from Datadog and Grafana into Elastic — dramatically reducing cost and complexity.

1. **Connect your existing platform**
   Point the tool at your Datadog org or Grafana instance using API credentials.

2. **Automatic conversion**
   Dashboards, panels, alert rules, and PromQL queries are translated to Elastic equivalents.

3. **Go live in Kibana**
   Your team is fully operational in Elastic with familiar workflows intact — same day.

elastic

A Lovable Kubernetes OOTB Experience

The most widely deployed cloud infrastructure

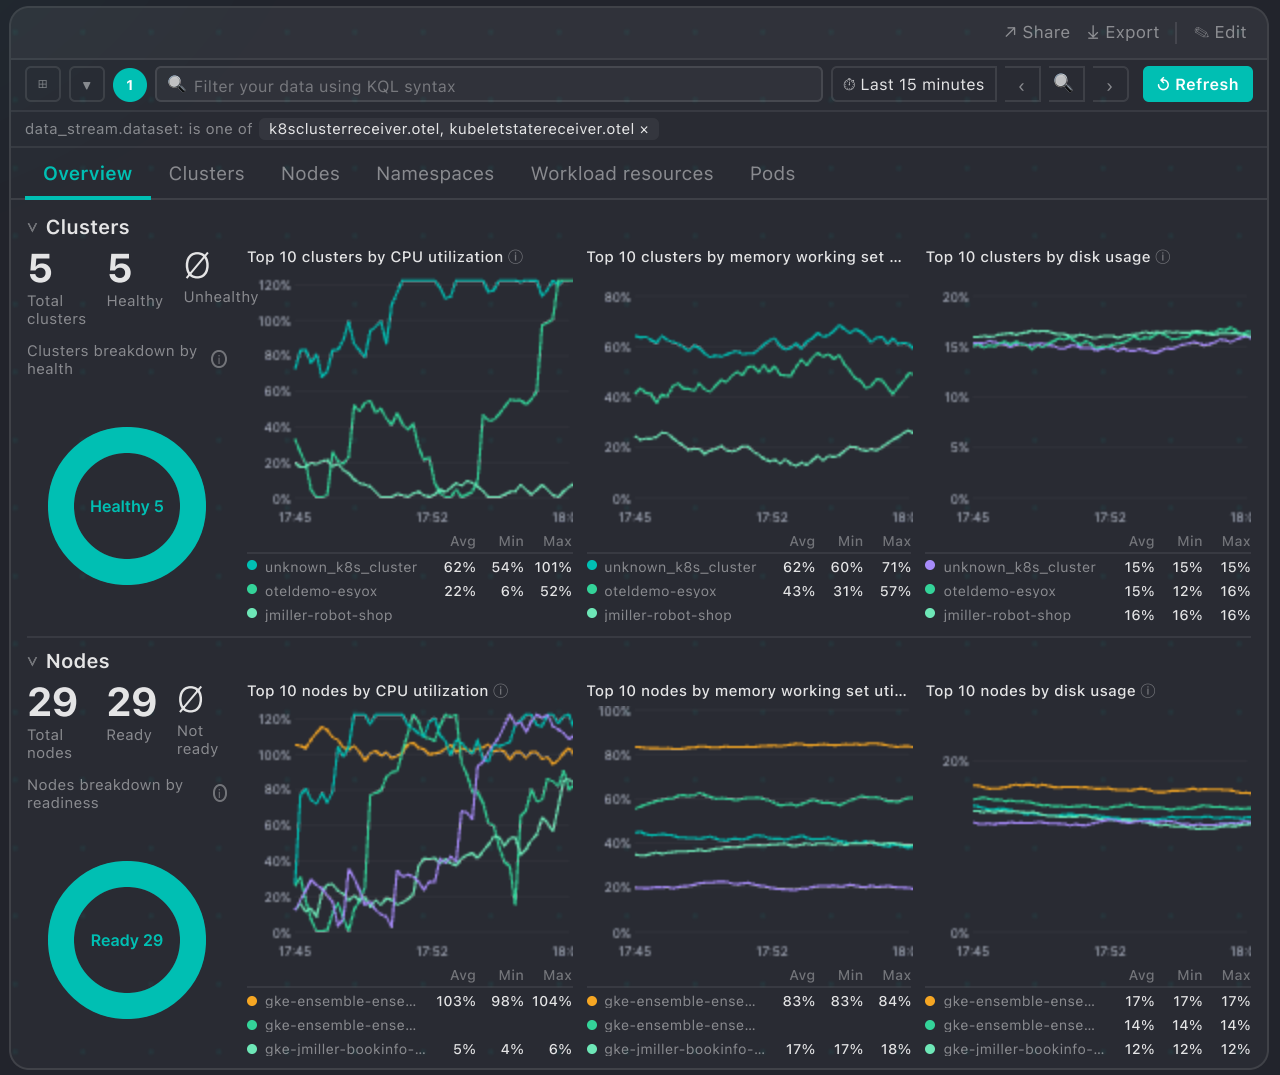

Why It Matters

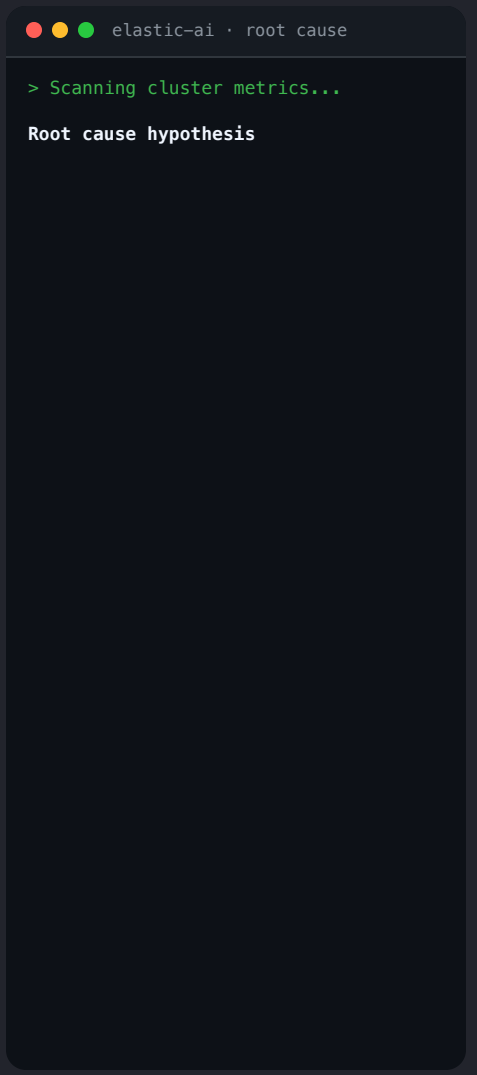

93% of companies using or evaluating Kubernetes

Customers are eager for richer monitoring and observability experiences that just work.

Enhanced OTel Experience

- Revamped Dashboards & Alerts
- OOTB SLOs & Agent Skills
- Kubernetes Workflows

elastic

Talk to your systems in plain English

Get results in plain language, inside your existing Agents and workflows.

Native MCP server

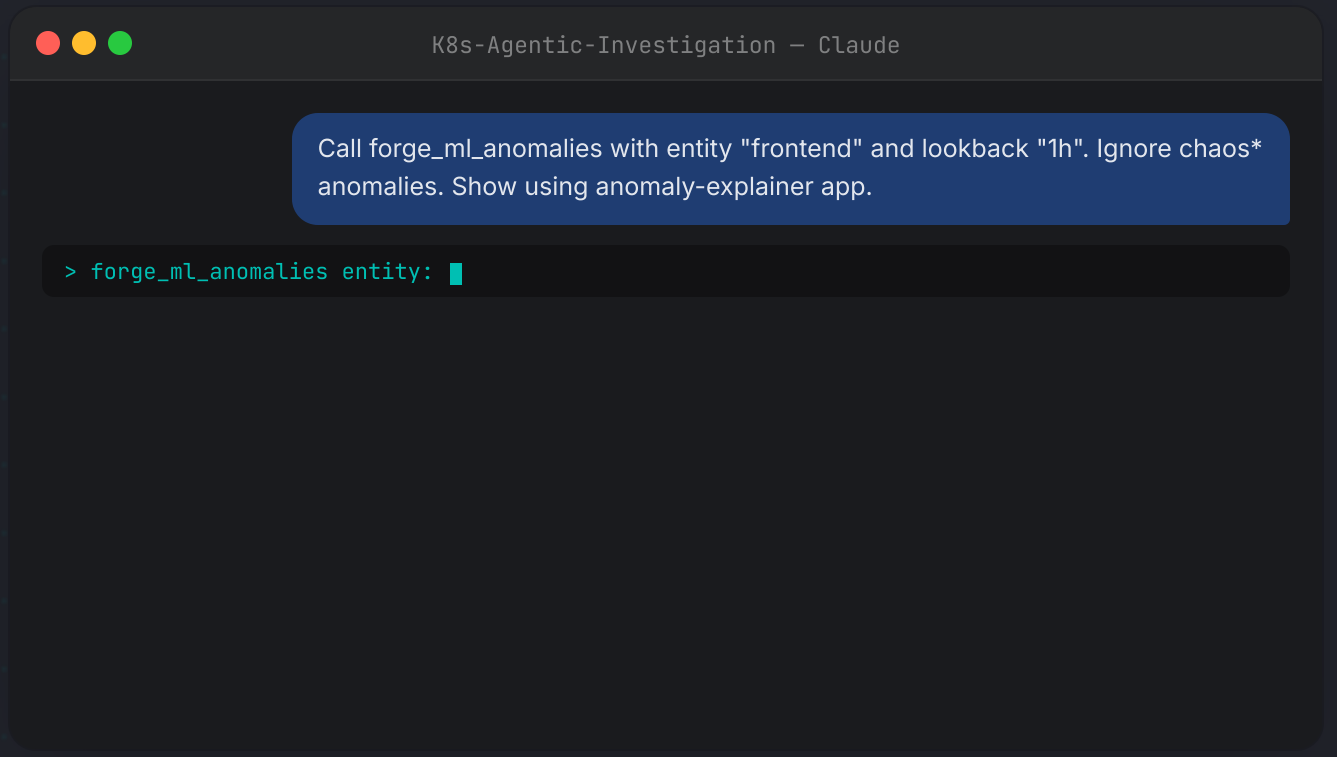

Connect any Claude-compatible client directly to your Elastic cluster.

Skills loaded automatically

Significant Events RCA, anomaly detection, and remediation — always available.

Surface-aware rendering

Results rendered as rich cards, not raw JSON — built for the interface you're using.

ELASTIC FOR CLAUDE · MCP INTEGRATION

Elastic MCP App for Kubernetes

Elastic's **MCP server** brings full observability into Claude: health dashboards, ML anomaly detection, and blast radius analysis, all through **natural language**.

- **Health Summary**
  Real-time system health across services and pods
- **Anomaly Explorer**
  ML-powered deviation detection with risk scoring
- **Blast Radius**
  Impact analysis when a service or node goes down

→ advance through the demo flow

elastic

Why Elastic wins metrics.

Five reasons this market is ours to take.

elastic

01

Performance at scale

30× faster query execution vs Prometheus. 6.6× better storage efficiency. Built on Elasticsearch's proven engine.

02

Zero migration friction

PromQL-native. Grafana-compatible. Existing dashboards and alerting rules transfer in hours, not months.

03

Unified platform

Metrics live alongside logs, traces, and synthetics. One query language. One bill. No fragmentation.

04

AI-ready by design

The same platform running Nightshift AI SRE. Metrics aren't isolated data — they feed the autonomous operations layer.

05

Strong GA entry

Shipped June 29, 2026. Not a preview — a production-grade release entering a $5B+ market from a position of strength.
